The design is an installation for the cultivation of micro-algae that connects two opposite riverbanks of the Amstel for pedestrians and cyclists. Meandering paths cross each other on different heights and give passers-by various opportunities to experience the element water. The project is a place for recreation and offers non-predefined but opportunity-rich space as a playground. While helping to regulate the river's water quality, the installation provides insights about dependencies in an ecosystem. The structure was developed with a script that statically evaluated randomly generated structures and passed the gained information on for continuous optimization processes, rendering out the clear handwriting of a designer. The spatial structure blurs natural and artificial components.
