We introduce InAs/AlAsSb as material system for quantum cascade detectors. The greatest benefit is the low effective mass of the well material that improves the total absorption of the detector and decreases the intersubband scattering rates, which increases the device resistance and thus enhances the noise behaviour. We have designed, grown, and measured a QCD that detects at a wavelength of $\lambda=4.84\mu\text{m}$ and shows a peak specific detectivity of approximately 2.7×10^7 Jones at $T=300\text{K}$ and 2.87×10^{10} Jones at 80K .
