We report on recent advances in chemical sensing applications based on surface and/or substrate emitting ring quantum cascade lasers (QCLs). QCLs can be implemented in monolithically integrated on-chip laser/detector compact sensor systems, twisted light beams can be generated on-chip from such rings by a monolithic gradient index meta-material fabricated directly into the substrate of the semiconductor chip, inducing a twist of the light's wavefront. The low threshold power of intersubband cascade lasers (ICLs) makes them very attractive for mobile systems. We will report on substrate emitting ICL ring lasers and the different polarization schemes of QCLs and ICLs.
